

## **BOOK REVIEW**

### **New Developments in Liquid Crystals Research**

**Editor:** Anka Trajkovska Petkoska (Associate Professor, University St. Kliment Ohridski-Bitola, Faculty of Technology and Technical Sciences-Veles, R. Macedonia)

Liquid crystalline materials are an impressive class of condensed matter combining mobility and order, which gives rise to their unique properties and enables outstanding applications usually associated with liquid crystal displays that can be found in TV screens, computer monitors, tablets, mobile phones, but also in more advanced applications in photonics, telecommunications, medicine and other fields.

A multidisciplinary approach has been always associated with the liquid crystal research. The book entitled "*New Developments in Liquid Crystals Research*" is an example of such approach by bringing together cutting-edge studies from respected researchers. In particular, the book is featuring research topics from different areas of liquid crystal science and engineering, such as shaped liquid-crystalline micro-particles, their encapsulation and electro-optic behavior, metallomesogens, liquid crystalline nanocomposites, and liquid crystal alignment.
